How are physical and chemical properties different?

S8P1D. DISTINGUISH BETWEEN PHYSICAL AND CHEMICAL PROPERTIES OF MATTER AS PHYSICAL (I.E., DENSITY, MELTING POINT, BOILING POINT) OR CHEMICAL (I.E., REACTIVITY, COMBUSTIBILITY)

Properties of Matter

- The properties of a substance are those characteristics that are used to identify or describe it
- A substance has characteristic properties which are independent of the amount of the sample [simply speaking, it doesn't matter how much of the substance you have, these properties are the same]
- Properties can be classified as Physical or Chemical

Physical Properties of Matter

- Properties that are observable, measurable, and will keep the same composition (nothing new is created)
- Some Physical Properties include:
 - Color Luster

Odor

Density

- Size Hardness
 - Condensing
- Conductivity Boiling point

Solubility

Melting point

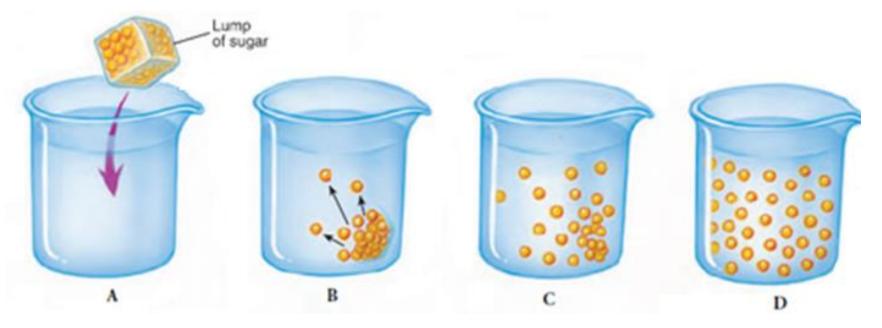

Physical Properties of Matter

- Some physical properties are easier to understand than others such as Color, Size, Odor, Luster (Shine), and Hardness
- Changes in state of matter such as melting, boiling, freezing, and condensing do not create a new substance and retain their original composition and is therefore a physical property

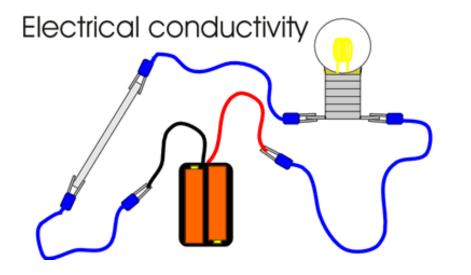

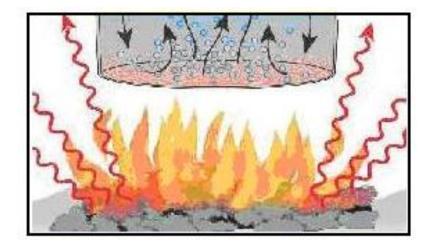

Physical Properties of Matter: Solubility

Solubility is the ability of a substance to dissolve in another substance. Flavored drink mix dissolves in water. Or, as the image shows, a lump of sugar dissolving in water.

Physical Properties of Matter: Conductivity Conductivity is the ability to conduct or transmit heat, electricity, or sound.

Physical Properties of Matter: Density

- Density is the amount of matter (mass) in a given space (volume)
- Density equals Mass divided by Volume (D=M/V)
- For example, a golf ball and a table-tennis ball have similar volumes. But a golf ball has more mass than a table-tennis ball does. So, the golf ball has a greater density.

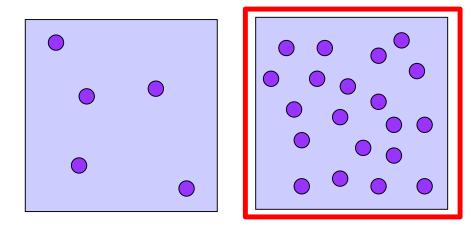

Physical Properties of Matter: Density of Solids Which would you rather carry around all day: a kilogram of lead or a kilogram of feathers?

At first, you might say feathers. But both the feathers and the lead have the same mass. However, the lead would be less awkward to carry around than the feathers would. Why?

The feathers are much less dense than the lead. So, it takes a lot of feathers to equal the same mass of lead.

Which square is more dense? Why?

Which square is more dense? Why?

There are more particles (matter) for the same space (volume)

The smaller square has the same number of particles, but in a smaller space (volume)

- Knowing the density of a substance can also tell you if the substance will float or sink in water.
- If the density of an object is less than the density of water, the object will float. Likewise, a solid object whose density is greater than the density of water will sink when the object is placed in water.
- Explore the Density of Solids and Water using the PhET simulation on density and buoyancy

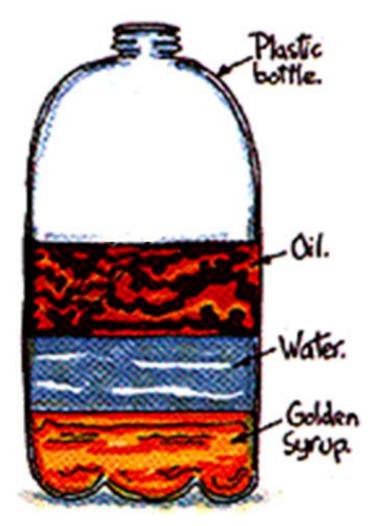

- Like all substances, liquids have different densities
- It is easy to see the differences in the density of liquids because more dense liquids will sink and less dense liquids will rise
- If you pour together liquids that don't mix and have different densities, they will form liquid layers.
- Making Liquid Layers: <u>http://www.youtube.com/watch?v=-CDkJuo_LYs</u>

3g/cm³

- Check out this picture. Which layer has the highest density?
- Which layer has the lowest a nsity?
- Imagine that the liquids have the following densities:
 - 10g/cm33g/cm36g/cm35g/cm3
- Which number would go with which layer?

Try with your neighbor!

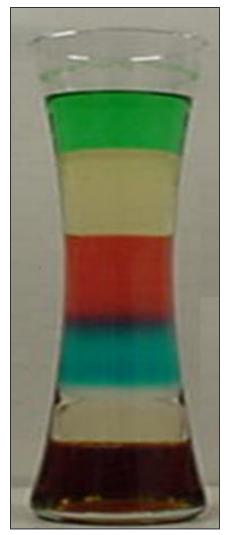

- Which liquid has the highest density?
- Which liquid has the lowest density?
- Which liquid has the middle density?

Try on your own!
Imagine that the liquids on the right have the following densities:

15g/cm ³	10g/cm ³
3g/cm ³	9g/cm ³
7g/cm ³	12g/cm ³

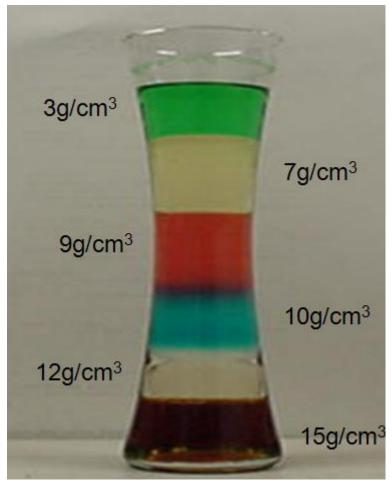

Match the colors to the correct densities.

Try on your own! Imagine that the liquids on the right have the following densities:

15g/cm ³	10g/cm ³
3g/cm ³	9g/cm ³
7g/cm ³	12g/cm ³

• Match the colors to the correct densities.

Chemical Properties of Matter

- Chemical properties are only observable during a chemical reaction and allows for change (something new is created)
- The property is the ability to change whereas the change is the action itself
- Some chemical properties include: Reactivity, Combustibility, Flammability

Chemical Property of Matter: Reactivity

- Reactivity describes how easily something reacts with something else
- Reactivity can also be described as the ability of a substance to combine with another substance and form a new substance
- Short clips showing the various reactions of elements with water

Chemical Property of Matter: Combustibility

- Combustibility is a substance or material that is able or likely to catch fire and burn
- Flammability is often described as a chemical property as well. Flammability occurs at a lower temp than combustibility
- Video clip showing various combustion reactions
- Whoosh Bottle Combustion Reaction video clip
